Individual Project –
Internship
Assignment

Artwork/Project Description

Project Summary: During my internship at Berijalan, I developed a web dashboard that turns AI-generated QC data from Excel into structured reports. The dashboard helps Team Leaders review Agent performance, recurring issues, and audit results in one place.

My Contribution & Impact: I first studied the existing QC process and compared AI-generated assessments with manual evaluations to understand which information needed to be shown. I then processed and structured the Excel data, stored it in PostgreSQL, and built the dashboard interface. This made the QC results easier to review than checking multiple raw spreadsheets and helped Team Leaders see important findings more clearly.

What I Learned: This project taught me how to understand a real operational problem before building the technical solution. I also learned that AI-generated results should still be reviewed carefully and that workplace data must be handled responsibly. The screenshots in this portfolio use anonymized demo data to protect confidential information.

Live Prototype – OmniOracle

Project Type

Group Project -
Competition

Artwork/Project Description

Project Summary: OmniOracle is a decentralized prediction market prototype developed for a Chainlink Web3 competition. It allows users to create markets, connect their wallets, submit predictions, and resolve outcomes through blockchain-based oracle services.

My Contribution & Impact: I worked on connecting wallet and smart-contract data to the user interface and supported the market creation, prediction, and resolution flows. I also contributed to features involving automated resolution, cross-chain functionality, and AI-assisted verification. My contribution helped the team turn the original idea into a working prototype that could demonstrate its main user flow during the competition.

What I Learned: This was my first project that combined web development, blockchain, oracle services, and AI in one product. I learned how to work with asynchronous blockchain transactions and changing contract states, while still presenting the process in a way that users could understand. It also encouraged me to learn unfamiliar technologies within a limited development period

Group Project-
Class Assignment

Artwork/Project Description

Project Summary: Atma Travel was developed as the final assignment for our Platform-Based Programming course. It is a Flutter-based travel management application for managing drivers, vehicles, and trip schedules.

My Contribution & Impact: I was responsible for developing the Admin module, including features for managing driver and vehicle data and adding delivery schedules. Because these records were connected, I had to make sure that the validation and data flow were handled carefully. My module provided the operational information needed by other parts of the application and helped keep driver, vehicle, and schedule data organized.

What I Learned: This project taught me how to design an admin interface that remains clear while handling several related datasets. I also improved my debugging skills by tracing problems across connected features instead of checking only one screen or function at a time.

Project Type

Group Project –
Class Assignment

Artwork/Project Description

Project Summary: ReuseMart is a web and mobile marketplace developed for our Software Development course. The platform allows users to buy, consign, and donate second-hand products through connected customer and administrative features.

My Contribution & Impact: I worked across UI/UX, frontend, and backend development. On the web application, I developed product-detail pages, donation features, and the Admin panel for managing products and donations. On mobile, I handled buyer and consignor profiles, purchase history, and consignment history. These features helped complete several important user and administrative flows across both platforms.

What I Learned: One of our main challenges was overlapping responsibilities, which caused function conflicts and Git merge issues. We handled this by dividing tasks more clearly and discussing changes before combining our work. From this project, I learned that clear communication and task ownership are just as important as technical skills when working in a full-stack team.

Role/Position

Machine Learning
Developer,
Streamlit Deployment

Publication Link

Streamlit - Mushroom
Type Prediction

Github - [Mushroom Type
Prediction](#)

Project Type

Group Project –
Class Assignment

Artwork/Project Description

Project Summary: This project was developed as the final assignment for our Machine Learning course. We created an image classification system that identifies mushroom types using more than 1,500 images collected and labeled by the team.

My Contribution & Impact: My main responsibility was implementing and training the AlexNet model. I also helped check and preprocess the dataset and contributed to the Streamlit deployment. This allowed us to present the model as a simple application where users could upload an image and receive a prediction instead of leaving the result only inside a development notebook.

What I Learned: I learned that model performance depends not only on the architecture but also on consistent labels, clean data, and proper preprocessing. This project gave me practical experience with the full machine-learning workflow, from preparing the dataset and training the model to presenting it through a usable application.
